OnePatient Hub (OPH)

Administrator Guide

Target audience: Facility Managers, Master System Administrators (craigianxx)

1. Master Administration & Global Scope

- The master administrator account (**craigianxx**) bypasses standard single-facility scoping rules, providing bird's-eye visibility across all regional clinics and hospitals.
- Admins can switch active operational contexts seamlessly to oversee multi-facility metrics.

2. Institutional Account Requests & Approvals

- **Account Request Workflow:** When new medical staff register via the public portal (`/request-account/`), administrators receive a prioritized alert in their Notification Center and a badge counter on the **Account Requests** tab.
- **Reviewing & Approving:** Navigate to *Administration* > *Account Requests* to inspect staff credentials, employee IDs, and requested roles (Nurse vs. Administrator).
- **One-Click Provisioning:** Approving a request instantly generates the user profile, links them to their specified facility, assigns their role, and issues a secure temporary password (`ChangeMe123!`).

3. Facility Management & Registry

- **Registering Facilities:** Add new health institutions to the hub by provisioning facility codes, province details, and physical addresses.
- **Active Staff Management:** Monitor active facility users, revoke facility access, or deactivate compromised staff profiles instantly.

4. Interoperability & Security Auditing

- **Audit Trail:** Access the immutable system activity log tracking logins, logouts, record updates, exports, and security overrides filtered by module.
- **FHIR & API Integration:** Manage organization resource bindings, API keys, REST endpoints (`/api/fhir/Organization/...`), and interoperability transactions.
